Week-15-Pointers: Attempt review | RECCIS

5-6 minutes

Status	Finished
Started	Tuesday, 14 January 2025, 4:52 PM
Completed	Tuesday, 14 January 2025, 5:46 PM
Duration	54 mins

Question 1

Correct

Marked out of 1.00

Question text

Given an array of integers, reverse the given array in place using an index and loop rather than a built-in function. **Example**

Return the array [5, 4, 2, 3, 1] which is the reverse of the input array.

Function Description

Complete the function reverseArray in the editor below.

reverseArray has the following parameter(s):

4

2

3

1

Explanation

The input array is [1, 3, 2, 4, 5], so the reverse of the input array is [5, 4, 2, 3, 1].

Sample Case 1 Sample Input For Custom Testing

4

17

10

21

45

Sample Output

45

21

10

17

Explanation

The input array is [17, 10, 21, 45], so the reverse of the input array is [45, 21, 10, 17].

Answer:(penalty regime: 0 %)

```
#include<stdlib.h>
int compare(void const *a,void const *b){
    return *(int *)b-*(int *)a;
}

int* reverseArray(int arr_count, int *arr, int *result_count) {
    *result_count=arr_count;
    // qsort(arr,arr_count,sizeof(int),compare);
    //int s=sizeof(arr);
    for(int i=0;i<(arr_count)/2;i++){
        int temp=arr[i];
        arr[i]=arr[arr_count-i-1];
        arr[arr_count-i-1]=temp;
    }

    return arr;
}</pre>
```

Feedback

Test	Expected	Got	
int arr[] = {1, 3, 2, 4, 5}; int result_count;	5	5	
int* result = reverseArray(5, arr, &result count); for (int i = 0; i <	4	4	
result_count; i++) printf("%d\n",	2	2	
*(result + i));	3	3	
	1	1	

Passed all tests!

Question 2

Correct

Marked out of 1.00

Question text

An automated cutting machine is used to cut rods into segments.

The cutting machine can only hold a rod of *minLength* or more, and it can only make one cut at a time. Given the array *lengths[]* representing the desired lengths of each segment, determine if it is

4 of 8 14-01-2025, 14:56

possible to make

the necessary

cuts using this machine. The rod is marked into lengths already, in the order given. **Example**

$$n = 3$$
 lengths =

minLength = 7

The rod is initially sum(lengths) = 4 + 3 + 2 = 9 units long. First cut off the segment of length 4 + 3 = 7 leaving a rod 9 - 7 = 2. Then check that the length 7 rod can be cut into segments of lengths 4 and 3. Since 7 is greater than or equal to minLength = 7, the final cut can be made. Return "Possible". **Example**

$$n = 3$$
 lengths =

[4, 2,

31

minLength = 7

The rod is initially sum(lengths) = 4 + 2 + 3 = 9 units long. In this case, the initial cut can be of length 4 or 4 + 2 = 6. Regardless of the length of the first cut, the remaining piece will be shorter than minLength. Because n - 1 = 2 cuts cannot be made, the answer is "Impossible".

Function Description

Complete the function *cutThemAll* in the editor below. *cutThemAll*

has the following parameter(s):

int lengths[n]: the lengths of the segments, in order int

minLength: the minimum length the machine can accept

Returns

string: "Possible" if all *n-1* cuts can be made. Otherwise, return the string "Impossible".

Constraints

$$2 \le n \le 10^5$$

$$1 \le t \le 10^9$$

- · 1 ≤ lengths[i] ≤ 10⁹
- The sum of the elements of lengths equals the uncut rod length.

Input Format For Custom Testing

The first line contains an integer, *n*, the number of elements in *lengths*.

Each line i of the n subsequent lines (where $0 \le i < n$) contains an integer, lengths[i].

The next line contains an integer, *minLength*, the minimum length accepted by the machine.

Sample Case 0 Sample Input For Custom Testing

STDIN Function

4 \rightarrow lengths[] size n = 4

 $3 \rightarrow lengths[] = [3, 5, 4, 3]$

5

4

3

 $9 \rightarrow minLength = 9$

Sample Output

Possible

Explanation

The uncut rod is 3 + 5 + 4 + 3 = 15 units long. Cut the rod into lengths of 3

+ 5 + 4 = 12 and 3. Then cut the 12 unit piece into lengths 3 and 5

The remaining segment is 5 + 4 = 9 units and that is long enough to make the final cut.

Sample Case 1 Sample Input For Custom Testing

STDIN Function

$$3 \rightarrow lengths[] size n = 3$$

$$5 \rightarrow lengths[] = [5, 6, 2]$$

6

2

12 → minLength= 12

Sample Output

Impossible

Explanation

The uncut rod is 5 + 6 + 2 = 13 units long. After making either cut, the rod will be too short to make the second cut.

Answer:(penalty regime: 0 %)

```
29 r char* cutThemAll(int l, long *lengths, long min) {
        long t=0, i=1;
30
        for(int i=0;i<=l-1;i++){
31 *
            t+=lengths[i];
32
33
        do{
34 ▼
            if(t-lengths[l-i-1]<min){</pre>
35 ₹
                 return "Impossible";
36
            }i++;
37
        }while(i<l-1);
38
        return "Possible";
39
40
41
    }
42
```

Feedback

Test	Expected	Got	
long lengths[] = {3, 5, 4, 3}; printf("%s", cutThemAll(4, lengths, 9))	Possible	Possible	
long lengths[] = {5, 6, 2}; printf("%s", cutThemAll(3, lengths, 12))	Impossible	Impossible	

Passed all tests!
